

Crime Study Using ArcGIS Online

This module demonstrates how to use an ArcGIS Online Account to conduct analysis of crimes. A guest account is being used to demonstrate this application instead of the author's administrative account.

1. Log in to your ArcGIS Online account.
2. Click on MAP from the top menu bar to open a new map
3. Click the down arrow next to the **Add** button and select "Add Layer from Web".

Add Layer from Web

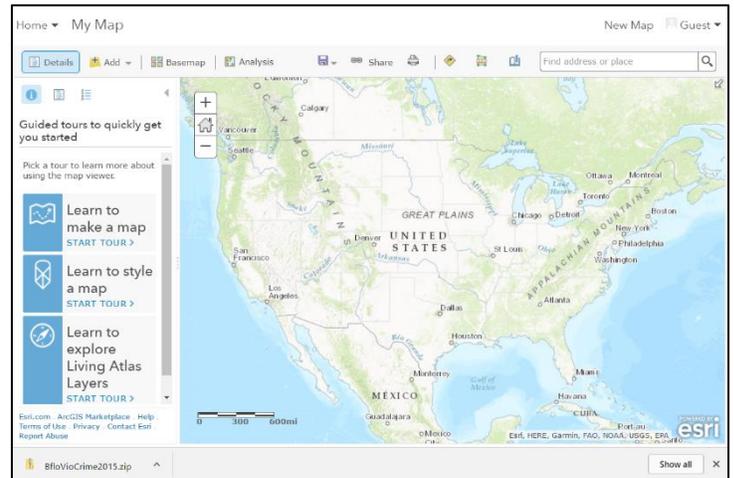

What type of data are you referencing?

An ArcGIS Server Web Service

URL: <https://geographyplanning.buffalostate.edu/arcgis/rest/services/BufaloCrime/ViolentCrimes/MapServer/0>

Use as Basemap

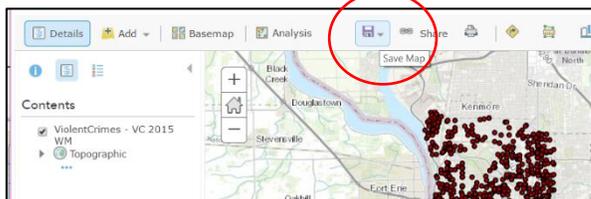

ADD LAYER CANCEL

Enter the URL: <https://geographyplanning.buffalostate.edu/arcgis/rest/services/BufaloCrime/ViolentCrimes/MapServer/0>

Click on **ADD LAYER**. You will get a warning about too many features to draw. All 3,405 of the crime locations are used in the analysis.

4. Save your map.

Save Map

Title: Violent Crime Analysis

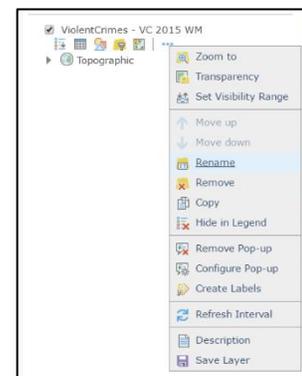

Tags: crime Buffalo NY Add tag(s)

Summary: Violent crime analysis in Buffalo NY 2015

Save in folder: guest2_BSCGEOG

SAVE MAP CANCEL

5. Click on the map layer name, then the ... to rename the layer.

Density and Hot Spots Analysis

Calculate Density

- 1 Choose point or line layer from which to calculate density
Violent Crimes Buffalo NY 2015
- 2 Use a count field (optional)
No count field
- 3 Result layer name
Violent Crimes Buffalo NY 2015 Density
Save result in: guest2_BSCGEOG

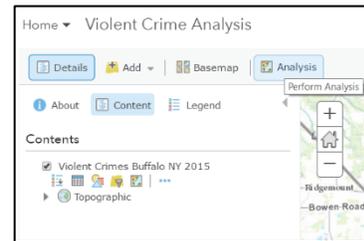

Options

Use current map extent [Show credits](#)

RUN ANALYSIS

Esri.com | ArcGIS Marketplace | Help | Terms of Use | Privacy | Contact Esri | Report Abuse

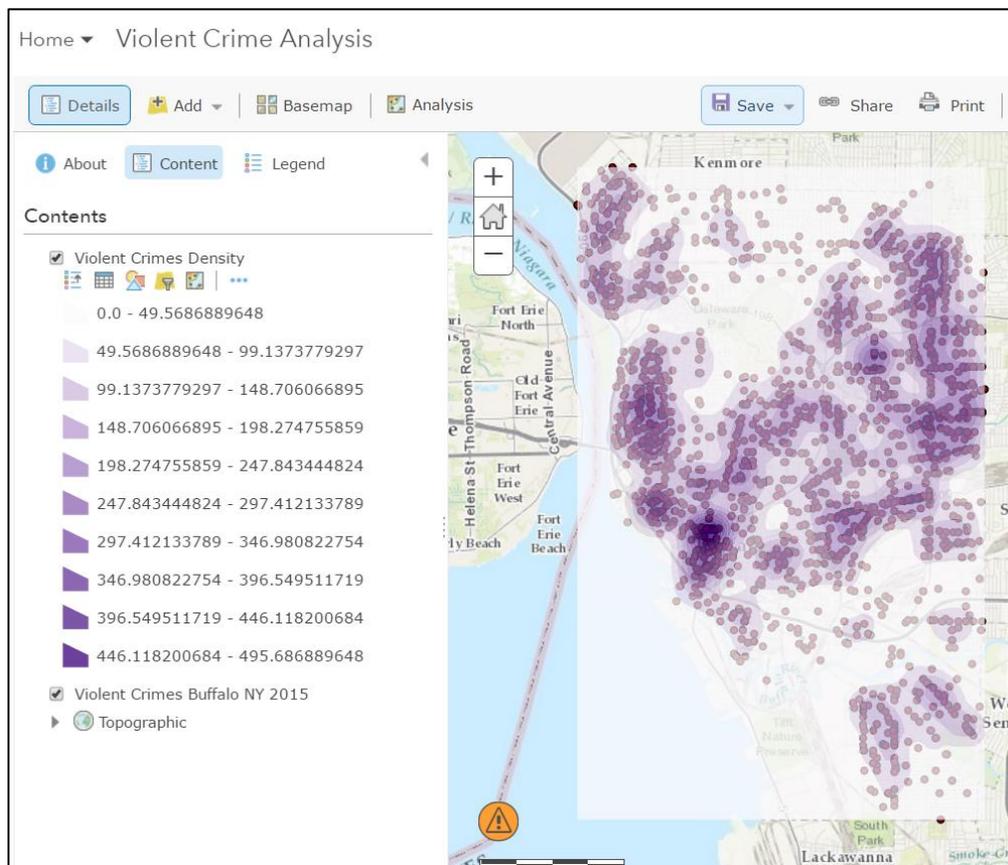

6. Click on **Analysis** in the

menu bar.

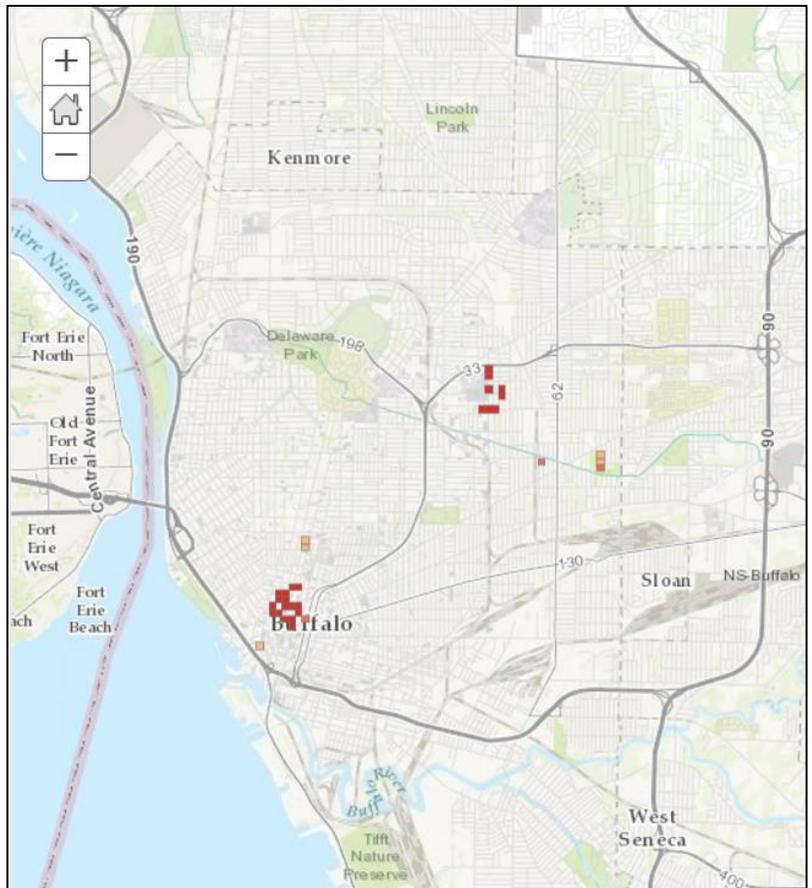

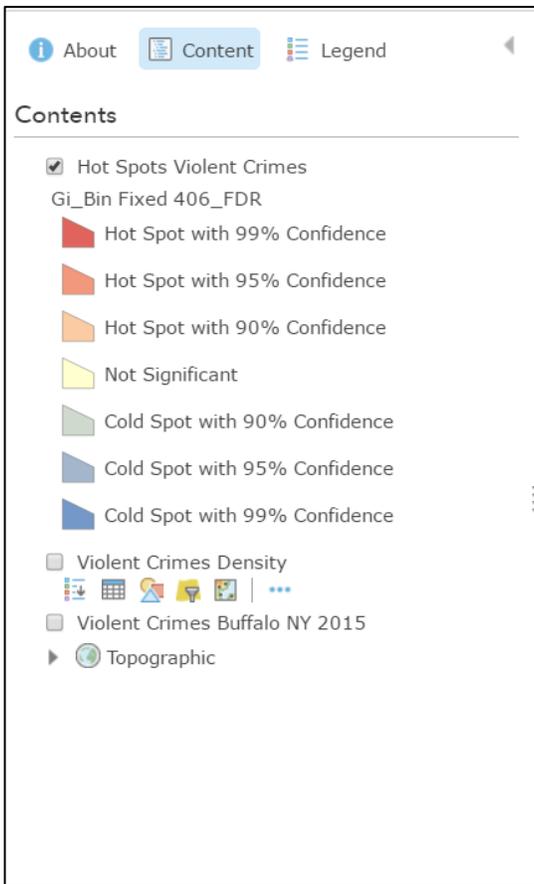

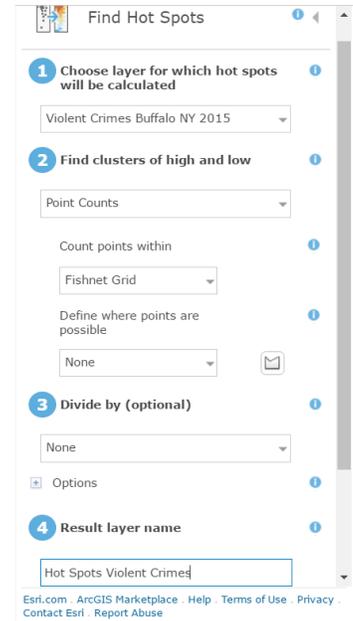

7. Click on **Analyze Patterns**, then **Calculate Density**. Leave all the options as is and click on **RUN ANALYSIS**. *Note: I changed the result layer name to Violent Crimes Density.*

A new analysis layer is added showing the number of violent crimes per square mile. You can make the point layer invisible and change the symbology of or set filters on the density layer.

8. Another analysis tool is to identify hot spots. Click on Analysis in the menu bar. Click on **Analyze Patterns**, then **Find Hot Spots**. Leave the default values and click on **RUN ANALYSIS**. *Note: I changed the result layer name to Hot Spot Violent Crimes.*

The tool creates a grid (fishnet) using the optimal cell size based on the study area size. Since there is no layer that defines where crimes occur (only within Buffalo city limits) the results will differ from those shown in the Portal exercise. The study area border was used to generate hot spots in that application.

9. You can add a border for Buffalo, NY using the Census TIGERweb Rest services for Incorporated places. Use the same steps as in (3) except the URL is:

https://tigerweb.geo.census.gov/arcgis/rest/services/TIGERweb/Places_CouSub_ConCity_SubMCD/MapServer/4

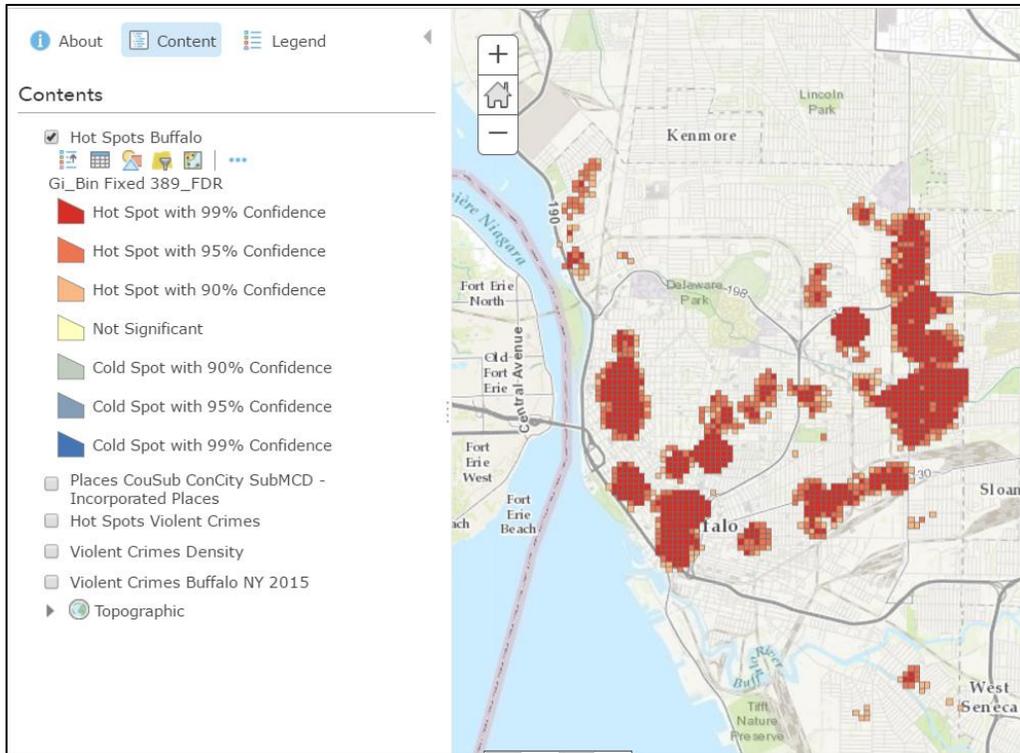

Unfortunately, the place boundary for Buffalo will include part of Lake Erie. Nevertheless, create a filter to show only Buffalo.

STATE is 36

BASENAME is Buffalo

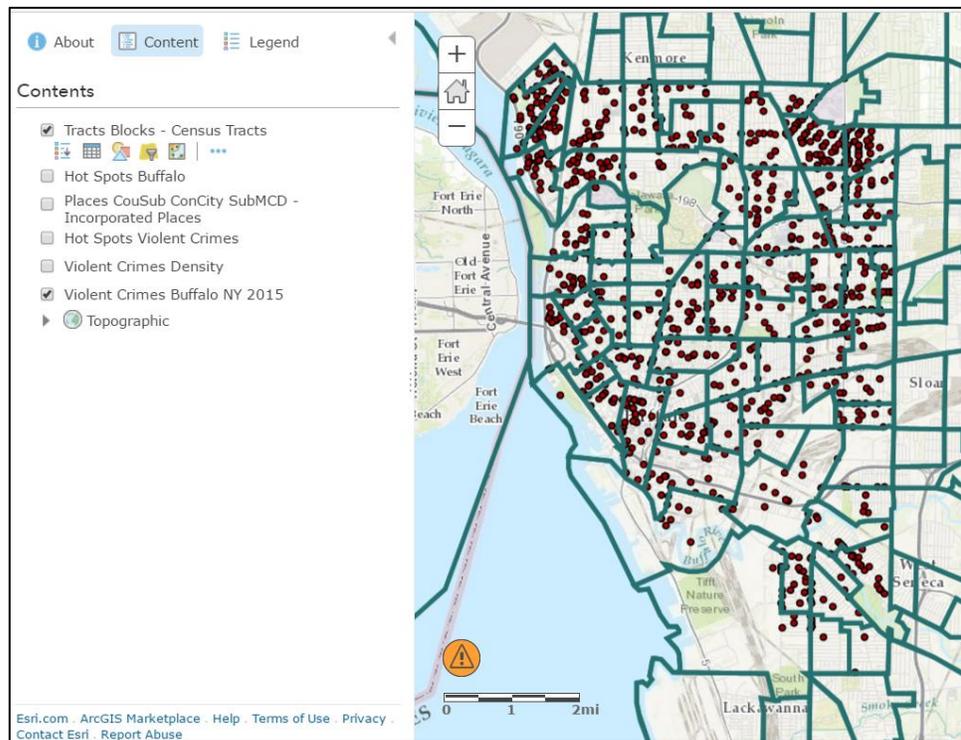

10. Re-run the find hot spots analysis except this time under **Define where points are possible** select the incorporated places layer. Before you run the analysis, uncheck Use current extent. (*Note: you can draw a study area boundary, too.*)

Set a filter on the new Hot Spots layer to show only those cells with significant z-scores. Gi_Bin Fixed 389_FDR is not 0. Incorporating a study area boundary results in significant changes in the Hot Spot analysis.

Crime Rate Analysis

- 11. Add the Census TIGER layer for census tracts using the URL:

https://tigerweb.geo.census.gov/arcgis/rest/services/TIGERweb/Tracts_Blocks/MapServer/0

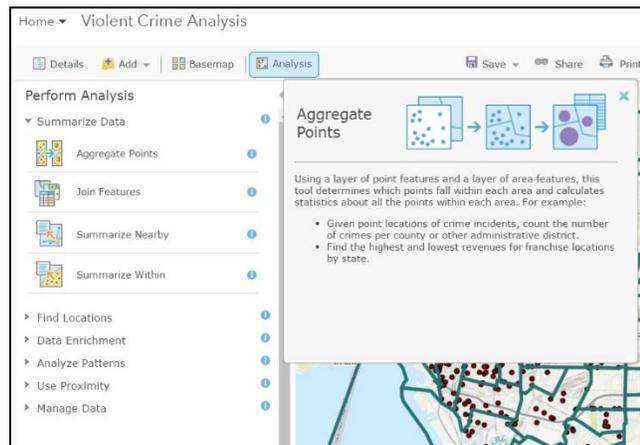

Click on Analysis in the menu bar. Click on **Summarize Data**, then **Aggregate Points**.

Leave the default values and Run the Analysis.

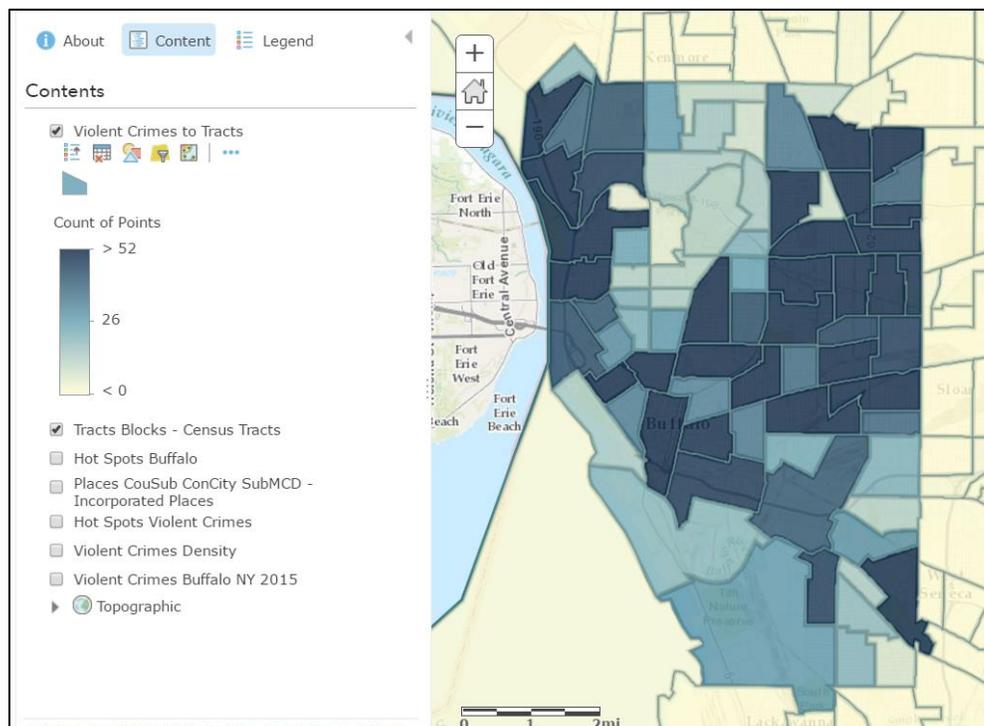

Aggregate Points

- Choose layer containing points to aggregate into areas**
Violent Crimes Buffalo NY 2015
- Choose layer containing aggregation areas**
Tracts_Blocks - Census Tracts
 Keep areas with no points
- Add statistics (optional)**
Field Statistic
- Choose field to group by (optional)**
Field
 Add minority, majority
 Add percentages
- Result layer name**
Violent Crimes to Tracts

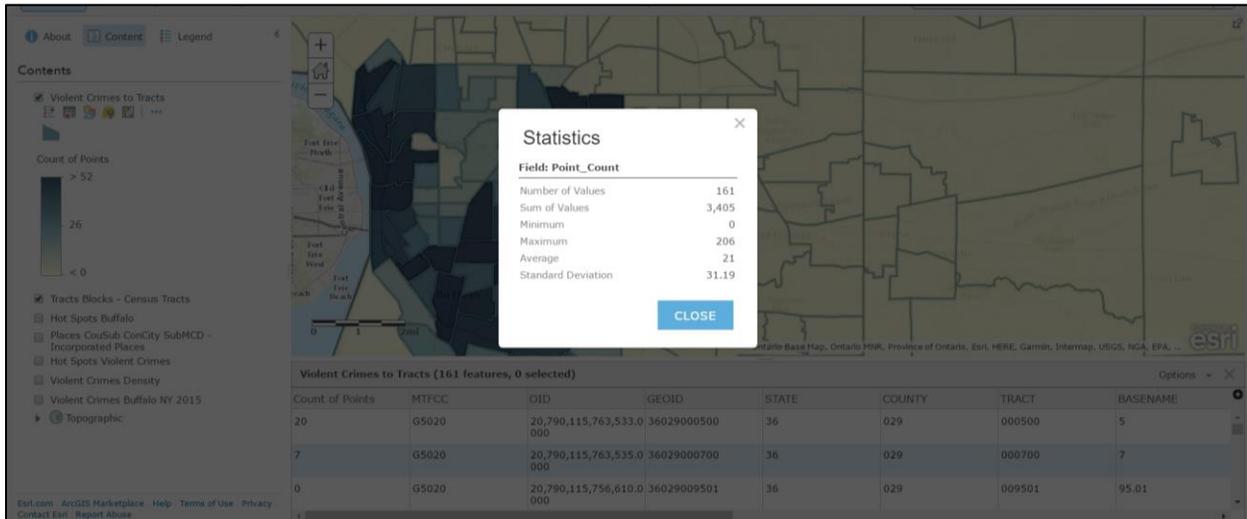

Esri.com ArcGIS Marketplace Help Terms of Use Privacy

The symbology of the new layer shown below was changed from Counts and Amounts (size) to Counts and Amounts (color).

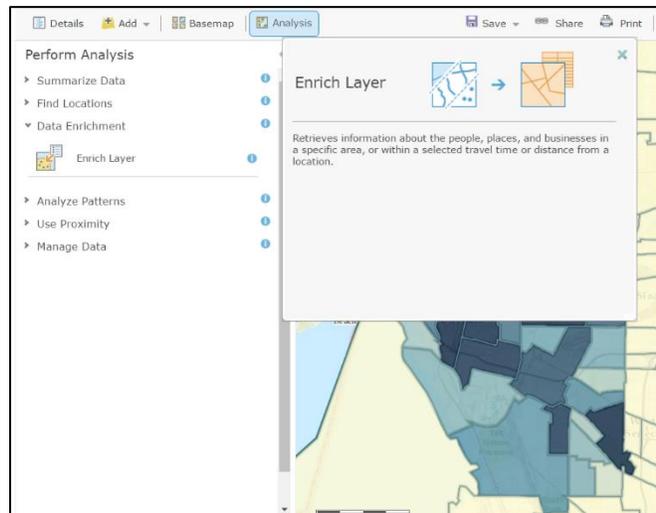

To verify that all crimes have been aggregated to the tracts, open the table for the new layer, click on the field “Count of points” and choose Statistics. The Sum of Values is 3,405.

12. Use the Data Enrichment tool to add population of each tract.

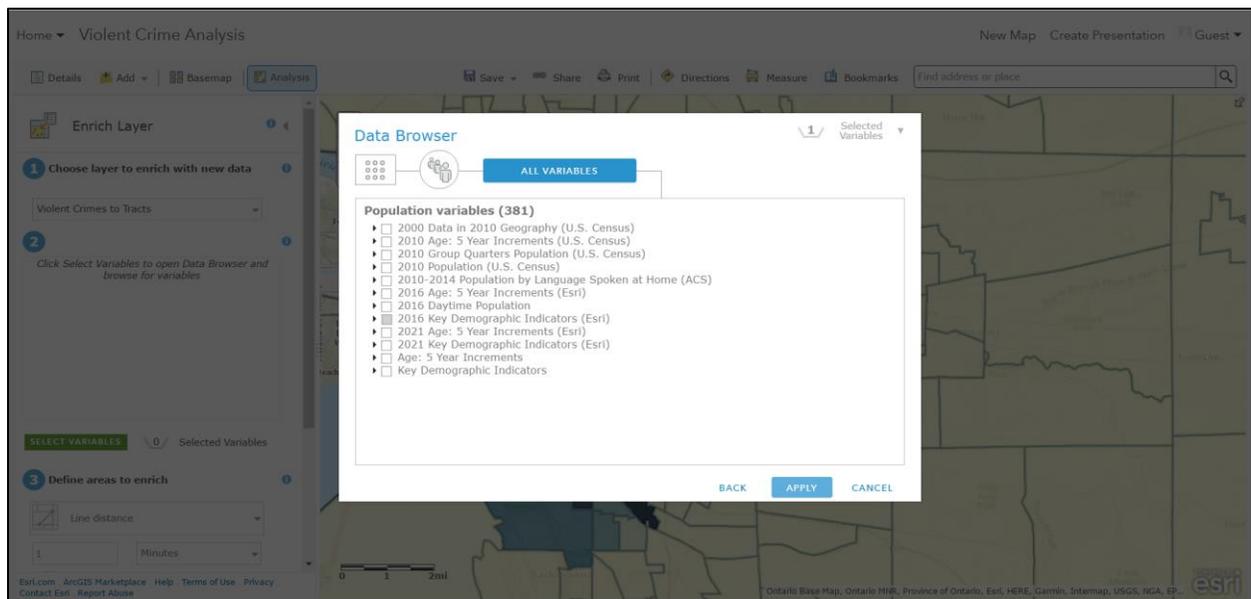

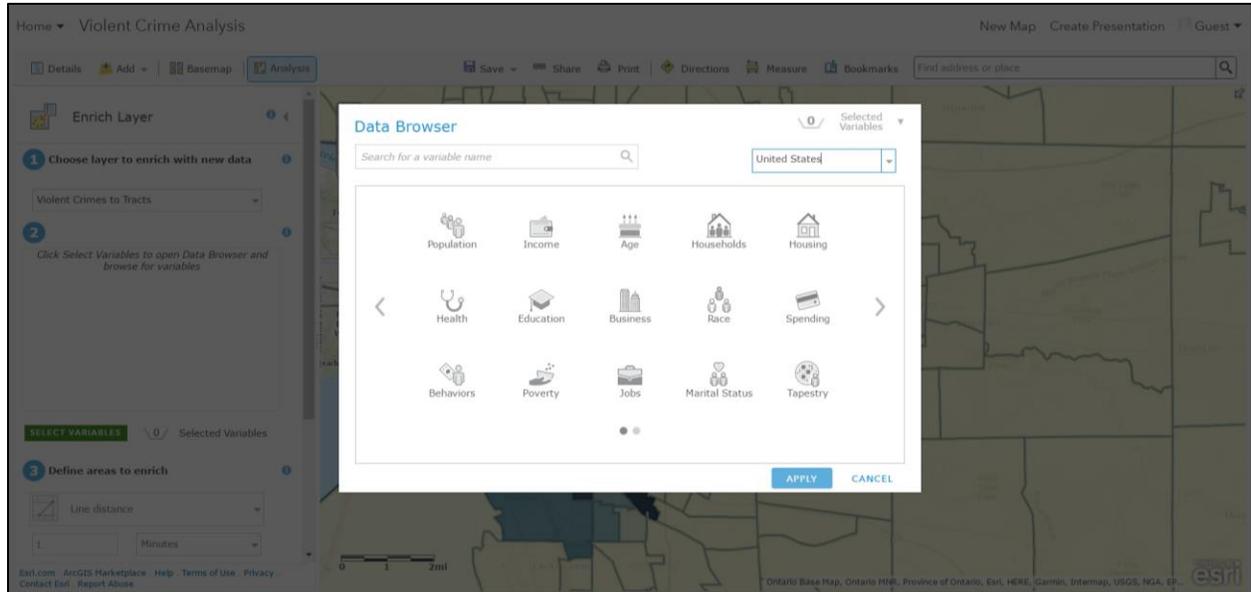

Make sure the layer to enrich is the Census tract layer. Click on **Select Variables**. You can add a wide variety of information to this layer. At this time we will only add population to determine crime rate.

Click on the population icon, then Show all population variables. Select the 2016 total population ESRI. The 2015 population data are not available through the data enrichment tool.

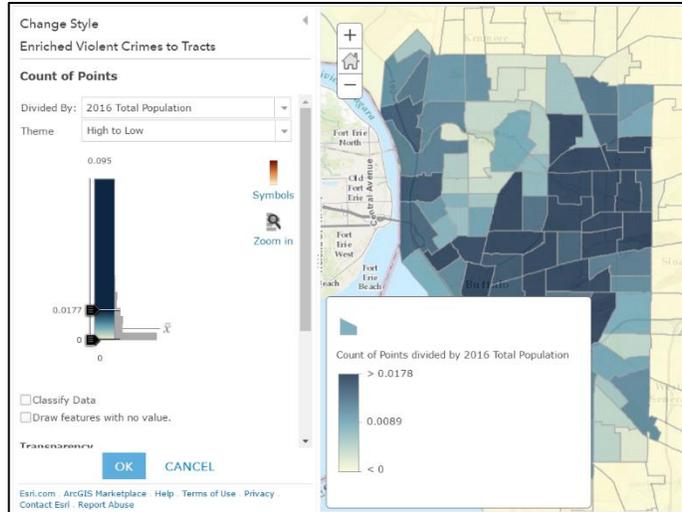

Click APPLY then RUN ANALYSIS.

Adjust the symbology of the enriched layer to show the crime rate: Count of Points divided by 2016 Total Population.

Before we calculate Hot Spots, set a filter on the enriched layer to show only tracts with Count of points greater than 0. You will see that during the aggregation process 2 tracts outside of Buffalo have crimes. This is because the location fell on the tract edge and was arbitrarily assigned to one of the bordering tracts.
